

CLOUD DELIVERED DESKTOPS EASE MERGER & ACQUISITION INTEGRATION

The Reality of M&As

The number of mergers and acquisitions have increased in recent years and that activity is not expected to slow down. In today's connected, digital world, IT initiatives play a strong role in the success of many of these transactions.

- 87% of professionals expect M&A deal activity to remain at the same level or increase
- 75% of corporations are targeting foreign M&A opportunities
- 50-60% of initiatives intended to capture synergies within an M&A situation are strongly related to IT

Ensuring a smooth integration following a merger or acquisition plays an important role in the transaction's success. But it's not an easy feat.

Every time an organization undergoes an M&A it faces a landslide of challenges, particularly when integrating workforces, networks and technologies. Companies must:

- Maintain workforce productivity
- Ensure application and data access for all employees, regardless of location
- Unify networks and technologies
- Protect corporate security and compliance

Connect with Cloud Delivered Desktops

Dizzion's fully managed cloud delivered desktops make it easier for organizations to address these challenges. Provisioned using customized Golden Images, organizations are able to get the entire collective workforce unified on consistent platforms and applications within hours or days - not months. This fast access to business-critical applications and data helps ensure productivity remains high while maintaining security.

With Dizzion's virtual desktops, organizations are able to utilize whatever endpoint devices are in place (or use [Dizzion's zLink](#) solutions) to deliver a consistent desktop experience to all employees. Companies can also support work at home programs, remote workers and third party contractors while maintaining a tight security posture from a centralized management portal.

Key Benefits

Easy Deployment

Provision new desktops in hours, not weeks, using hardware that's already in place.

Central Management

Control all desktops from a single pane of glass, regardless of office or employee locations.

Security & Controls

More than 100 user controls to quickly and easily implement security measures across groups.

Compliant Solutions

Independently audited PCI and HIPAA compliant solutions help organizations more easily achieve and maintain compliance.

Consistent User Experience

Ensure all employees have access to the data and applications they need within a consistent desktop environment.

Secure the Endpoint

Protect corporate data from the threat of device theft or loss. Control where your data resides and get it off the endpoint.

IT Challenges Following a Merger or Acquisition

Responsibility	Challenge	Dizzion Benefit
Enabling Productivity	Issuing access to business-critical applications and data and managing hardware.	Manage desktops and application access from a single, centralized location, deployable to any endpoint, anywhere.
Simplify Networking	Waiting weeks or months for a physical network connection (circuit) to be established to a new remote office.	Employees anywhere can use a secure virtual desktop that already has access to all the applications and data they need.
Consistent User Experience	Creating and maintaining a consistent user experience across locations and departments.	Ensure one user group doesn't have a better or worse desktop experience by having a standard desktop configuration.
Security	With more data and corporate IP to protect, IT teams need to ensure all employees are following security rules and working on secure endpoints.	With virtual desktops, user and computer controls can be automatically pushed out and devices pose less of a threat.
Compliance	Compliance is notoriously difficult to maintain, especially when new end users and endpoints are introduced.	A compliant DaaS solution can help easily and quickly ensure all employees are working within a compliant environment.
Active Directory	If the acquired company does not have Active Directory user accounts, the new endpoints must be configured to join the acquiring company's domain.	Virtual desktops can be remotely provisioned to automatically join a domain, rather than touching and configuring each individual endpoint.
